

## Palisade Bio Initiates Phase 3 Study of LB1148 in Lead Indication for Postoperative Return of Bowel Function

June 29, 2022

*Completion of enrollment for Phase 3 study targeted within 18-24 months*

*In multiple clinical studies, LB1148 has demonstrated statistically significant acceleration in the time to the return of normal GI function, and has the potential to prevent damage to GI tissues and shorten the duration of costly post-surgery hospital stays*

*Phase 3 study design utilizes same dosing protocol and same primary endpoint as positive Phase 2 study that demonstrated 1.1-day improvement in return of bowel function*

CARLSBAD, Calif., June 29, 2022 (GLOBE NEWSWIRE) -- [Palisade Bio](#) (Nasdaq: PALI), a clinical stage biopharmaceutical company advancing therapies for acute and chronic gastrointestinal (GI) complications, today announced the initiation of its Phase 3 study evaluating LB1148 to accelerate the return of bowel function in adult patients undergoing gastrointestinal surgery. The first clinical site in the U.S. is now open.

"Initiation of this study represents a landmark milestone for Palisade Bio as LB1148 enters Phase 3 clinical development. If approved, we believe LB1148 has the potential to be established as the standard of care for millions of patients undergoing abdominal surgeries each year," commented Tom Hallam, Ph.D., Chief Executive Officer of Palisade Bio.

[LB1148](#), the Company's lead asset in development, is a novel oral liquid formulation of the well-characterized digestive enzyme inhibitor tranexamic acid, with the potential to both reduce abdominal adhesions and help restore bowel function following surgery. LB1148 is currently being developed for administration prior to surgeries that are at risk of disrupting the intestinal epithelial barrier.

"Delayed postoperative return of bowel function is a common complication after many kinds of surgery and is often an obstacle to patient discharge, which causes an increase in hospital length of stay and expenses, in addition to causing the patient discomfort. To date, LB1148 has been shown to be well-tolerated and has demonstrated statistically significant results in the acceleration in return of GI function. Based on this data and utilizing the proven study design from prior studies, we are advancing LB1148 forward in the clinic. If it is ultimately approved, LB1148 would provide a desperately needed solution to protect intestinal integrity during surgery. We look forward to unlocking the full potential of LB1148," added Michael Dawson, M.D., Chief Medical Officer of Palisade Bio.

The Phase 3 study is designed as a multi-centered, randomized, double-blind, parallel-group, placebo-controlled clinical trial set to enroll approximately 600 patients, which will assess the safety and efficacy of LB1148. The primary endpoint is time to recovery of the upper and lower gastrointestinal tract following surgery, defined as the time from the end of surgery to the toleration of food and first bowel movement. All patients enrolled in the study will undergo a scheduled bowel resection surgery that will include either laparotomy or laparoscopic surgical approaches. The clinical study will utilize the same dosing protocol used in the Company's completed Phase 2 study that demonstrated a 1.1-day improvement in return of bowel function. Based on management's current study projections and timelines, enrollment is targeted for completion within 18-24 months.

### **About LB1148**

LB1148 is an oral formulation of a broad-spectrum serine protease inhibitor designed to neutralize the activity of potent digestive proteases released from the gut during surgery. Evidence suggests that the release of digestive proteases contributes to the temporary loss of normal gastrointestinal function and the formation of postoperative adhesions. By inhibiting the activity of these digestive proteases, LB1148 has the potential to prevent damage to GI tissues, accelerate the time to the return of normal GI function, and shorten the duration of costly post-surgery hospital stays.

### **About Palisade Bio**

Palisade Bio is a clinical stage biopharmaceutical company advancing therapies that aim to aid patients suffering with acute and chronic gastrointestinal complications stemming from post-operative digestive enzyme damage. Palisade Bio's innovative Phase 3 lead asset LB1148, is a protease inhibitor with the potential to both reduce abdominal adhesions and help restore bowel function following surgery. Positive data from Phase 2 studies of LB1148 demonstrated safety and tolerability as well as a statistically significant improvement in the return of bowel function and a decrease in the length of stay in ICU and hospital compared to placebo. Palisade Bio believes that its investigational therapies have the potential to address the myriad health conditions and complications associated with the chronic disruption to the gastrointestinal epithelial barrier.
